USB Lan Cards If you are looking for a good USB Lan Card driver to use with Windows 7 Professional or Windows 8.1, you've come to the right place. It provides a lot of features and has been stable throughout the release of these two different operating systems. The name "qhm8106 usb lan card" should give you a hint that this is what it's going to be referred to henceforth--the computer itself, that is! When installed, it will add an Ethernet port into your computer that will allow you to connect all your computers in the LAN party. The first part of the driver I should point out is the arrow button. The arrow key gives you a choice of two buttons labeled as "Connect" and "Disconnect" as well as, a small lock icon which will allow you to toggle between connecting or disconnecting from your computer. Essentially, this will let you set it up for a LAN party, place your printer on it and connect to the internet wirelessly. This is simple to do--let's first take a look at how it's a good device for people who are just getting into networking. If you look at the top of the card, you will see that it has a light green button which is basically "on". It has a clover leaf-shaped button which is really for selecting what function you wish to use; we'll talk about it later. Now, if you need an easy and simple USB device to get your LAN party started, this is your card: You can connect all the devices in the LAN party to this one card and let them communicate wirelessly. It includes all the features that most people would need; there may be some ifconfig commands that someone could run here and there but for most people, it's pretty straightforward. We're going to start with the Installer, which is the first feature that pops up when you insert it into your computer. The installer is very simple. You just select where you want to install the software and whether or not you need to uninstall previous drivers. The next step will allow you to plug in your LAN card so it can be detected.

After you do so, the installer will automatically download necessary software for functionality and will also execute an "Install" button on another window, allowing users to continue on with the process without installing any unnecessary features they don't need; only what they choose. When the process finishes, it will ask you to reboot your computer. You can choose if you want to do it immediately or later. After the reboot, you insert the LAN card into an available port and it should detect software necessary for connectivity with your computer.

The next part is just installing some additional software that may be needed for different applications that are your use; if you're not sure what to do, just let it install everything on its own by hitting "Next" on the window. \t After this, unplug the driver and plug in another Ethernet cable on top of it! The green LED on top of the driver should light up.
